

CS 4644 / 7643-A

DANFEI XU

Topics:

- Machine learning intro, applications (CV, NLP, etc.)
- Parametric models and their components

(Slide source: Prof. Zsolt Kira)

- **PS0: This should take less than 3hrs!**
- Please do it now, and give others a chance at waitlist if your background is not sufficient (beef it up and take it next time)
 - Do it even if you're on the waitlist!
- **Piazza:** not all enrolled!
 - Enroll now! <https://piazza.com/gatech/fall2023/cs46447643/home>
- **Office hours** start next week
- **Start finding your project partners**

- **Collaboration**
 - Only on HWs and project (not allowed in HW0/PS0).
 - You may discuss the questions
 - Each student writes their own answers
 - Write on your homework anyone with whom you collaborate
 - Each student must write their own code for the programming part
 - Do NOT search for code implementing what we ask; search for concepts
- **Zero tolerance on plagiarism**
 - Neither ethical nor in your best interest
 - Always credit your sources
 - Don't cheat. We will find out.

- **Grace period**
 - 2 days grace period for each assignment (**EXCEPT PS0**)
 - Intended for checking submission NOT to replace due date
 - No need to ask for grace, no penalty for turning it in within grace period
 - Can NOT use for PS0
- **After grace period, you get a 0 (no excuses except medical)**
 - Send all medical requests to dean of students (<https://studentlife.gatech.edu/>)
 - Form: https://gatech-advocate.symplicity.com/care_report/index.php/pid224342
- **DO NOT SEND US ANY MEDICAL INFORMATION!** We do not need any details, just a confirmation from dean of students

Learn Numpy!

CS231n Convolutional Neural Networks for Visual Recognition

Python Numpy Tutorial

This tutorial was contributed by [Justin Johnson](#).

We will use the Python programming language for all assignments in this course. Python is a great general-purpose programming language on its own, but with the help of a few popular libraries (numpy, scipy, matplotlib) it becomes a powerful environment for scientific computing.

We expect that many of you will have some experience with Python and numpy; for the rest of you, this section will serve as a quick crash course both on the Python programming language and on the use of Python for scientific computing.

<http://cs231n.github.io/python-numpy-tutorial/>

Slide Credit: Fei-Fei Li, Justin Johnson, Serena Yeung, CS 231n

Machine Learning Overview

When is Machine Learning useful?

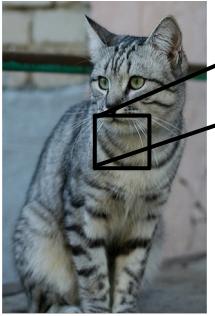

```
algorithm quicksort(A, lo, hi) is
    if lo < hi then
        p := partition(A, lo, hi)
        quicksort(A, lo, p - 1)
        quicksort(A, p + 1, hi)

algorithm partition(A, lo, hi) is
    pivot := A[hi]
    i := lo
    for j := lo to hi do
        if A[j] < pivot then
            swap A[i] with A[j]
            i := i + 1
    swap A[i] with A[hi]
    return i
```

When it's difficult / infeasible to write a program

Example: Object Recognition

What the computer sees
What the computer sees

An image is just a big grid of numbers between [0, 255]:

e.g. 800 x 600 x 3
(3 channels RGB)

A Massive Google Network Learns To Identify — Cats

June 26, 2012 · 3:00 PM ET

Heard on [All Things Considered](#)

4-Minute Listen

+ PLAYLIST

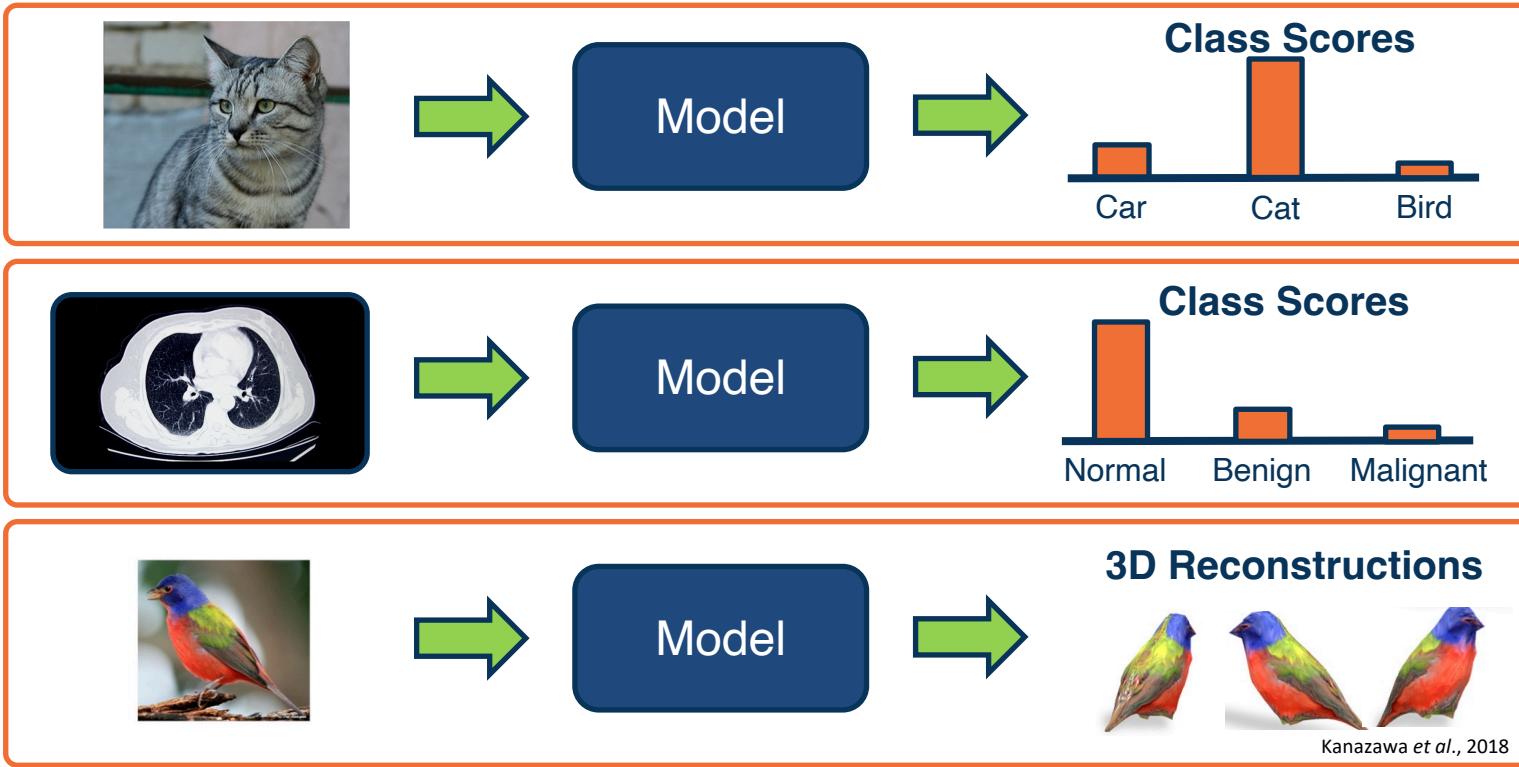

All Things Considered host Audie Cornish talks with Andrew Ng, Associate Professor of Computer Science at Stanford University. He led a Google research team in creating a neural network out of 16,000 computer processors to try and mimic the functions of the human brain. Given three days on YouTube, the network taught itself how to identify — cats.

Deep Learning

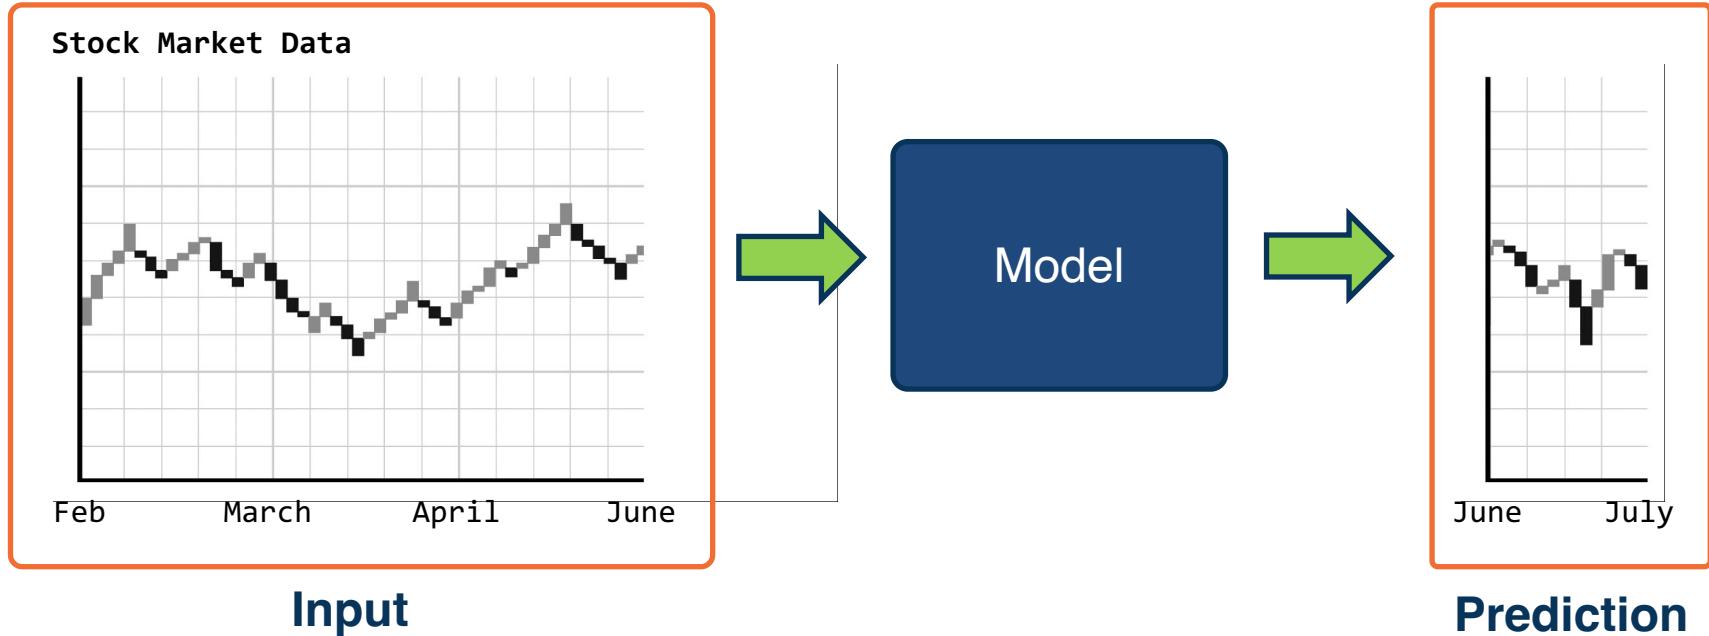

Application: Computer Vision

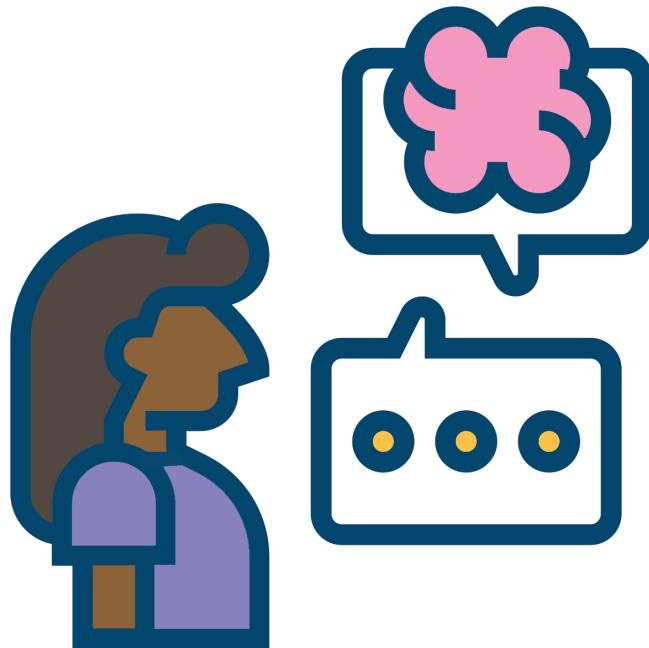

Example: Image Classification

Application: Time Series Forecasting

Example: Time Series Forecasting

Application: Natural Language Processing (NLP)

Very large number of NLP sub-tasks:

- ◆ Syntax Parsing
- ◆ Translation
- ◆ Named entity recognition
- ◆ Summarization
- ◆ Similarity / paraphrasing

Sequence modeling: Variable length sequential inputs and/or outputs

Recent progress: Large-scale Language Models

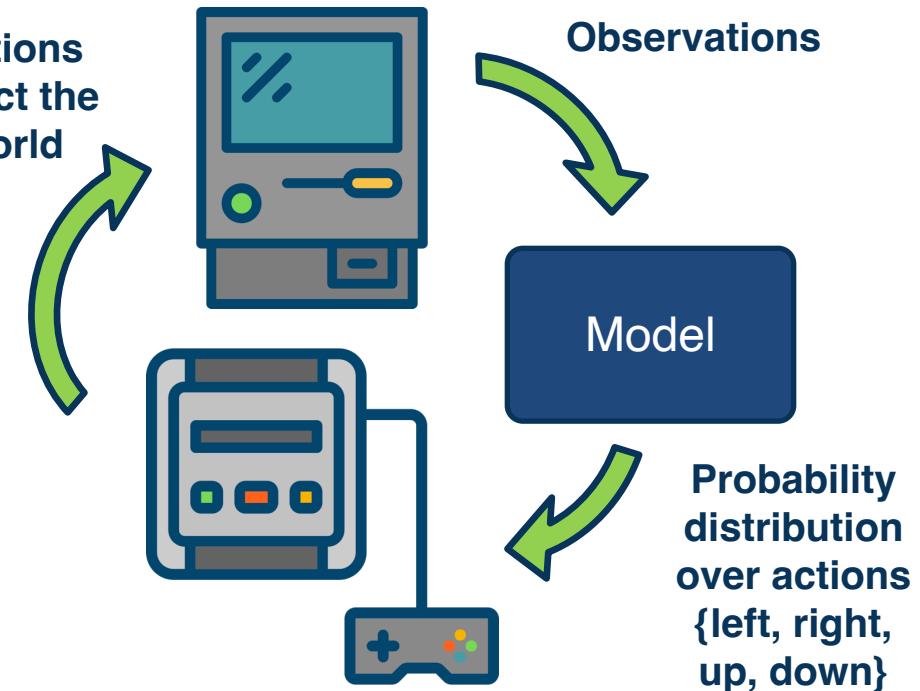

Example: Natural Language Processing (NLP)

Application: Decision Making

- Sequence of inputs/outputs
- Actions affect the environment

Examples: Chess / Go, Video Games, Recommendation Systems, Web Agents ...

Example: Video Game

Example: Decision-Making

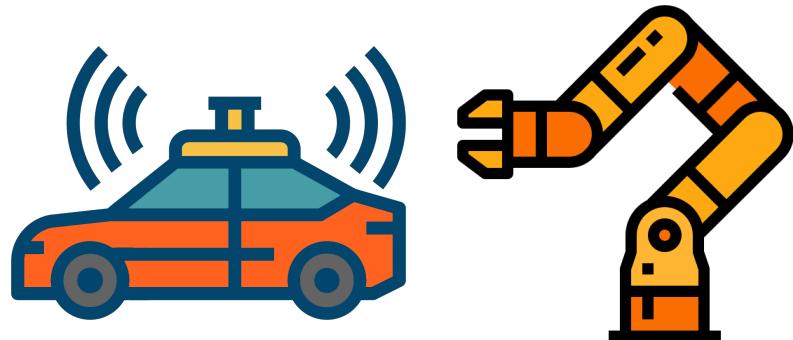

Robotics involves a **combination** of AI/ML techniques:

- ◆ **Sense:** Perception
- ◆ **Plan:** Planning
- ◆ **Act:** Controls

Some things are **learned** (perception), while others programmed

An evolving landscape

Application:

Example: Robotics

Rest of the lecture (also next lecture):

- ◆ **Types of Machine Learning Problems**
- ◆ **Parametric Models**
- ◆ **Linear Classifiers**
- ◆ **Gradient Descent**

**Supervised
Learning**

**Unsupervised
Learning**

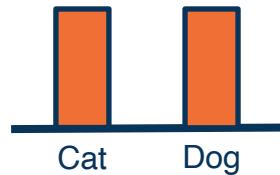

**Reinforcement
Learning**

Types of Machine Learning

Supervised Learning

- Train Input: $\{X, Y\}$
- Learning output: $f : X \rightarrow Y$
- Usually f is a **distribution**,
e.g. $P(y|x)$

<https://en.wikipedia.org/wiki/CatDog>

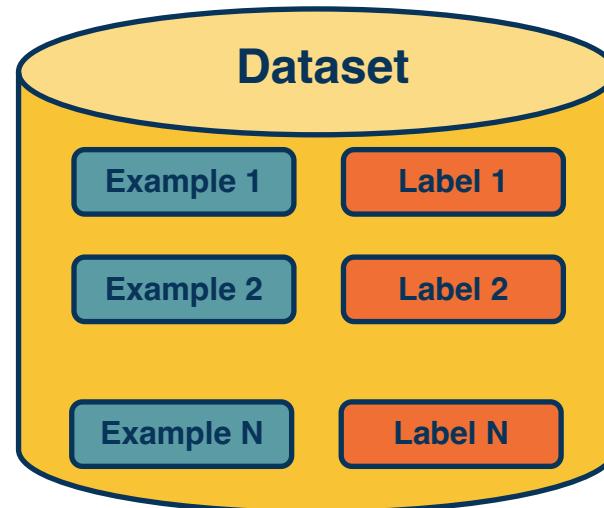

Dataset

$X = \{x_1, x_2, \dots, x_N\}$ where $x \in \mathbb{R}^d$

Examples

$Y = \{y_1, y_2, \dots, y_N\}$ where $y \in \mathbb{R}^c$

Labels

Types of Machine Learning

Supervised Learning

- ◆ Train Input: $\{X, Y\}$
- ◆ Learning output: $f : X \rightarrow Y$,
e.g. $p(y|x)$

Terminology:

- ◆ Model / Hypothesis Class
 - ◆ $H : \{f : X \rightarrow Y\}$
 - ◆ Learning is search in hypothesis space

E.g., $H = \{f(x) = w^T x \mid w \in \mathbb{R}^d\}$

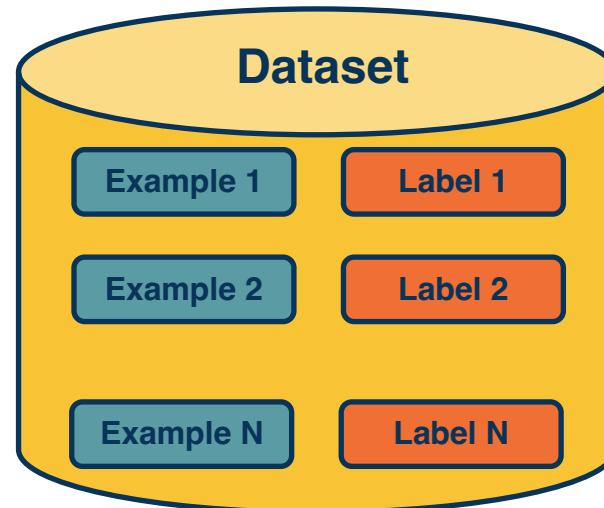

Dataset

$X = \{x_1, x_2, \dots, x_N\}$ where $x \in \mathbb{R}^d$

Examples

$Y = \{y_1, y_2, \dots, y_N\}$ where $y \in \mathbb{R}^c$

Labels

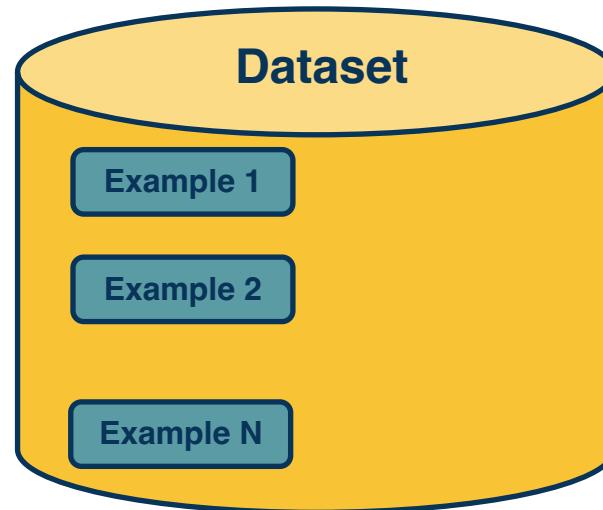

Types of Machine Learning

Unsupervised Learning

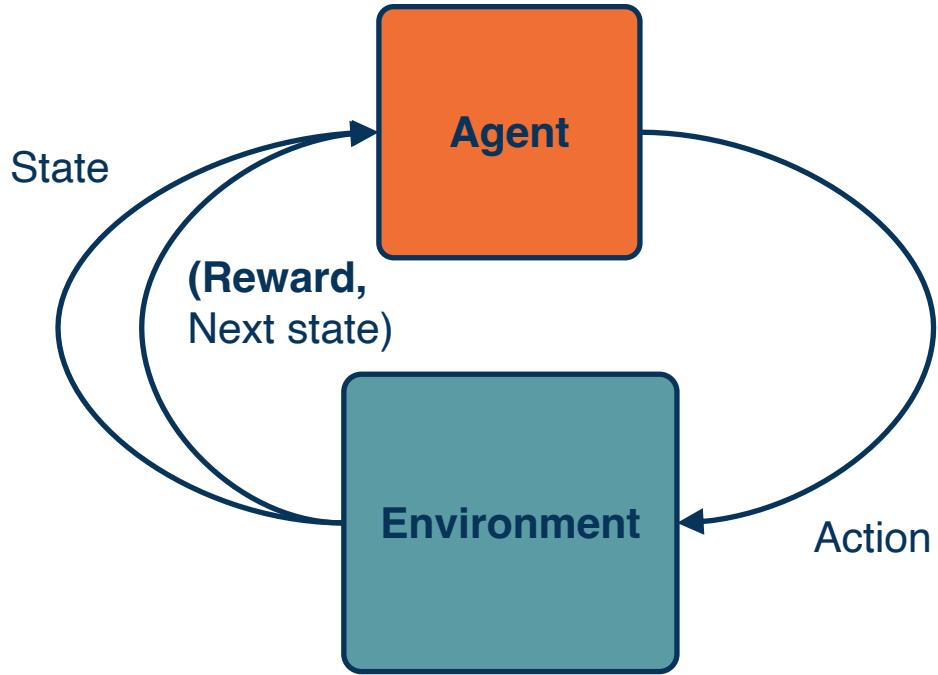

- ◆ Input: $\{X\}$
- ◆ Learning output: $p_{data}(x)$
- ◆ How likely is x under p_{data} ?
- ◆ Can we sample from p_{data} ?
- ◆ Example: Clustering, density estimation, generative modeling, ...

Dataset Examples

$$X = \{x_1, x_2, \dots, x_N\} \text{ where } x \in \mathbb{R}^d$$

Reinforcement Learning

- Supervision in form of reward
- No supervision on what action to take

Adapted from: http://cs231n.stanford.edu/slides/2020/lecture_17.pdf

Supervised Learning

- ◆ Train Input: $\{X, Y\}$
- ◆ Learning output:
 $f : X \rightarrow Y$,
e.g. $P(y|x)$

Unsupervised Learning

- ◆ Input: $\{X\}$
- ◆ Learning output: $P(x)$
- ◆ Example: Clustering, density estimation, etc.

Reinforcement Learning

- ◆ Supervision in form of **reward**
- ◆ No supervision on what action to take

Very often combined, sometimes within the same model!

Rest of the lecture (also next lecture):

- ◆ Types of Machine Learning Problems
- ◆ **Parametric Models**
- ◆ Linear Classifiers
- ◆ Gradient Descent

Non-Parametric Model

No explicit model for the function,
examples:

- ◆ Nearest neighbor classifier
- ◆ Decision tree

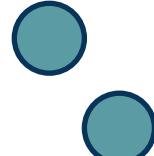

Hypothesis class changes with
the number of data points

Non-Parametric – Nearest Neighbor

Example 1, cat

Example 2, dog

Example 4, dog

Query

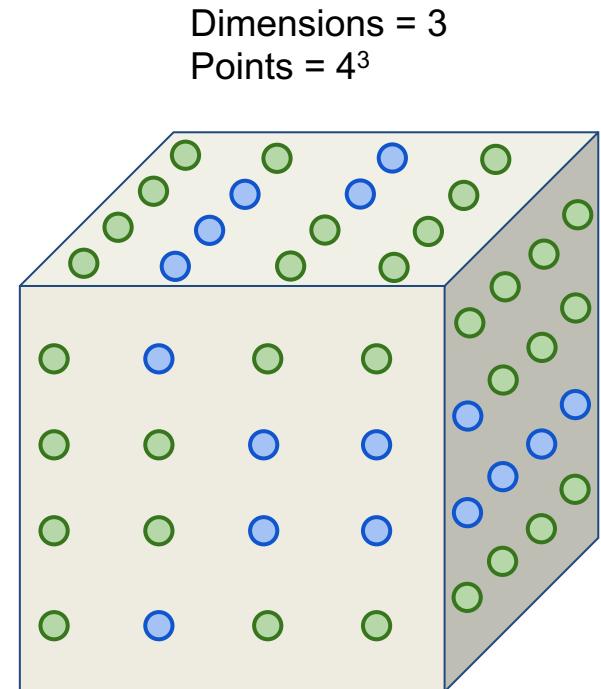

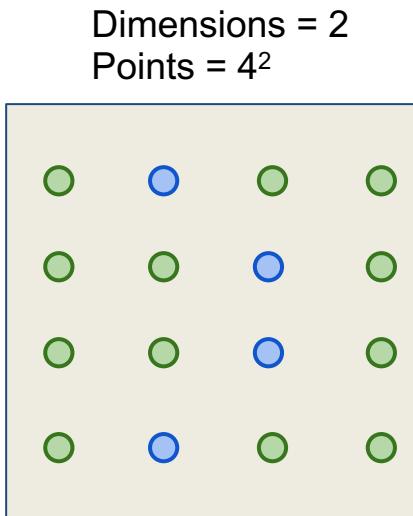

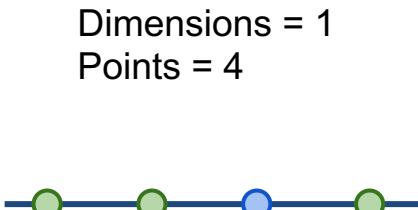

Example 3, car

Procedure: Take label of nearest example

k-Nearest Neighbor on high-dimensional data (e.g., images) is *almost never* used.

Curse of dimensionality

Slide Credit: Fei-Fei Li, Justin Johnson, Serena Yeung, CS 231n

Curse of Dimensionality

- **Curse of Dimensionality**
 - Data required increases exponentially with the number of dimensions
- **Doesn't work well when large number of irrelevant features**
 - Distances overwhelmed by noisy features
- **Expensive**
 - No Learning: most real work done during testing
 - For every test sample, must search through all dataset – very slow!
 - Must use tricks like approximate nearest neighbor search

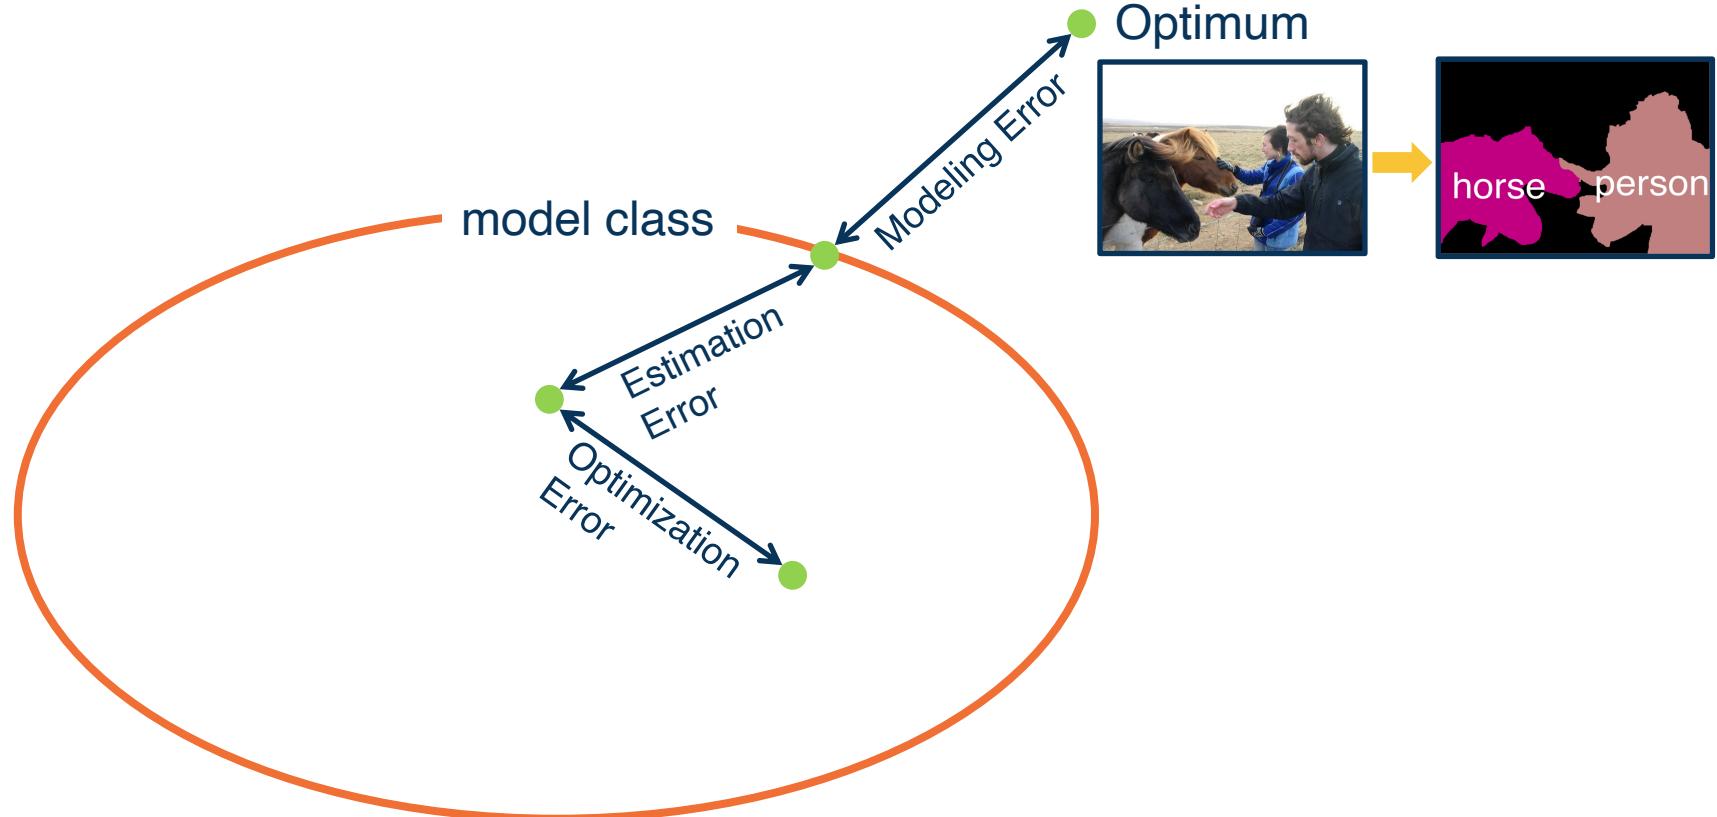

Parametric Model

Explicitly model the function $f : X \rightarrow Y$ in the form of a parametrized function
 $f(x, W) = y$, **examples:**

- ◆ Linear classifier
 - ◆ Number of parameters grows **linearly** with the number of dimensions!
- ◆ Neural networks
- ◆ Hypothesis classes doesn't change

Parametric – Linear Classifier

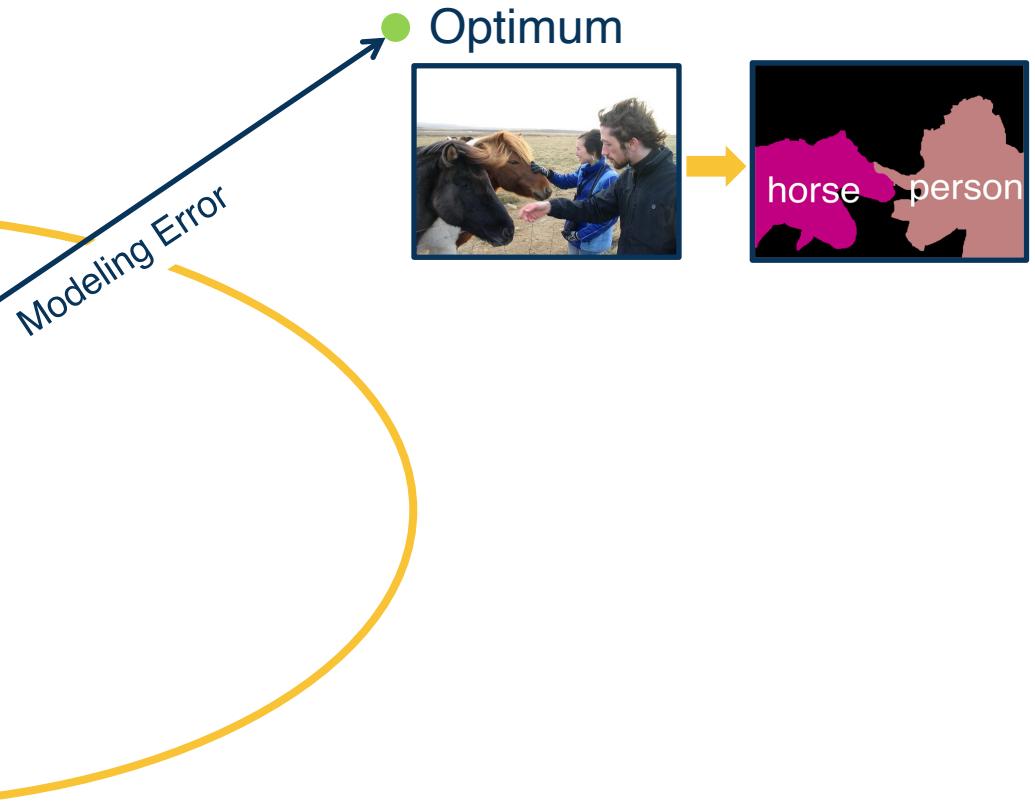

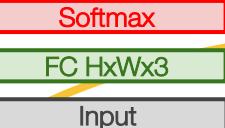

$$f(x, W) = Wx + b$$

From: slides by Fei-Fei Li, Justin Johnson, Serena Yeung, CS 231n

Generalization

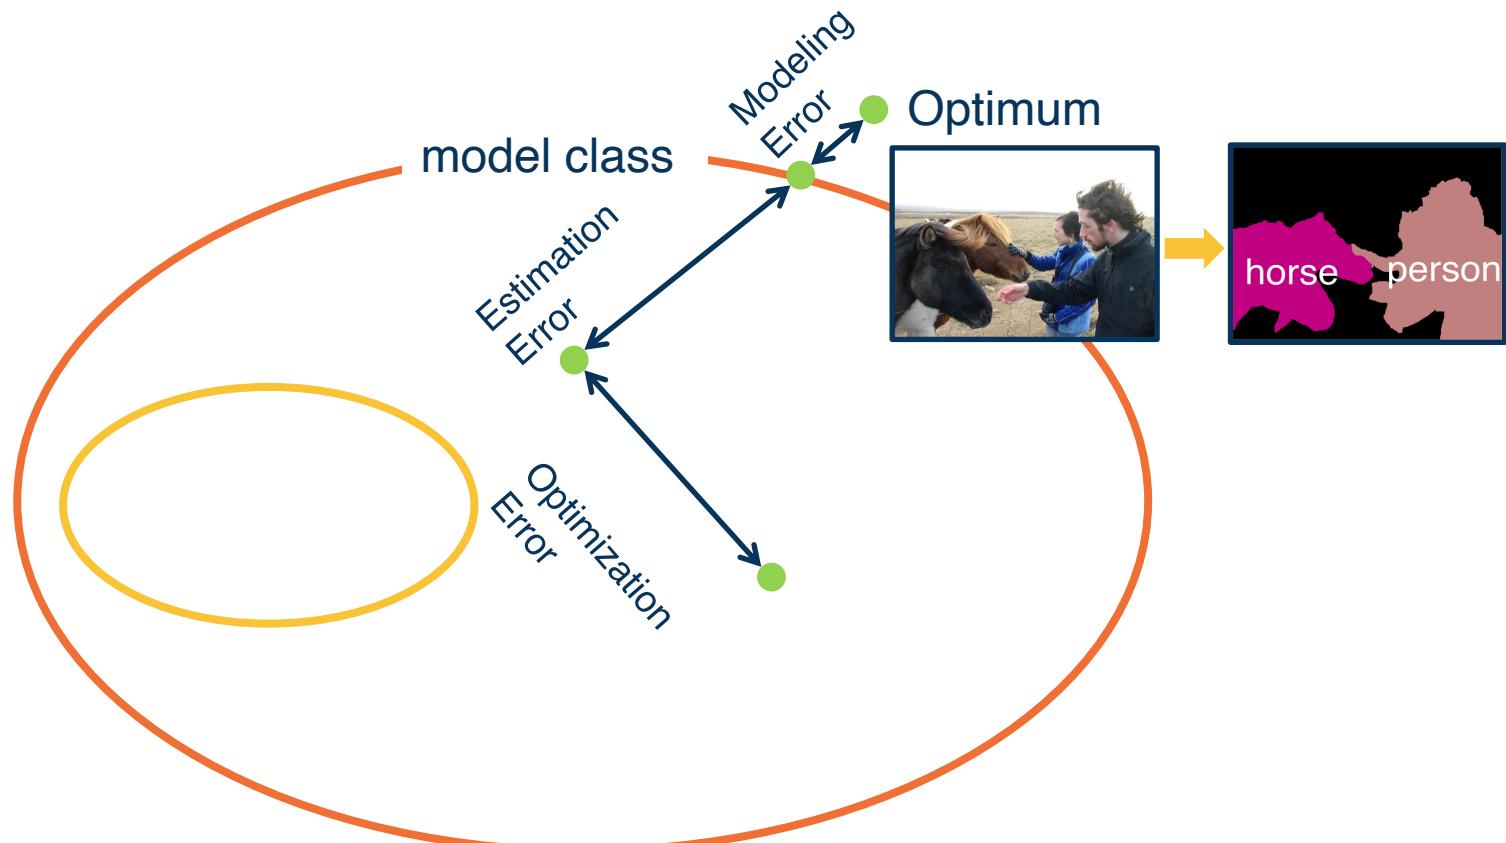

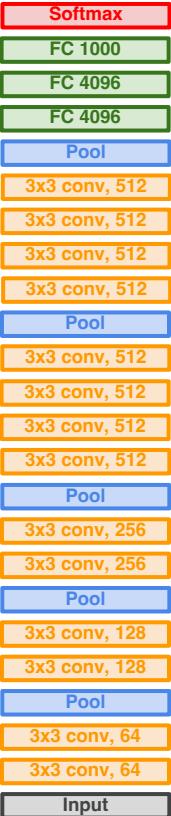

Multi-class Logistic Regression

Types of Errors and Generalization

Rest of the lecture (also next lecture):

- ◆ Types of Machine Learning Problems
- ◆ Parametric Models
- ◆ **Linear Classifiers**
- ◆ Gradient Descent

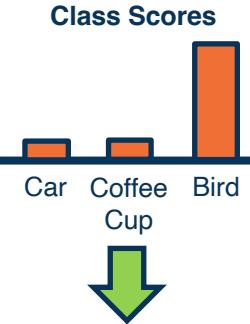

Input

- Functional form of the model
 - Including parameters
- Performance measure to improve
 - Loss or objective function
- Algorithm for finding best parameters
 - Optimization algorithm

Data: Image

$$\text{Model} \\ f(x, W) = Wx + b$$

Loss Function

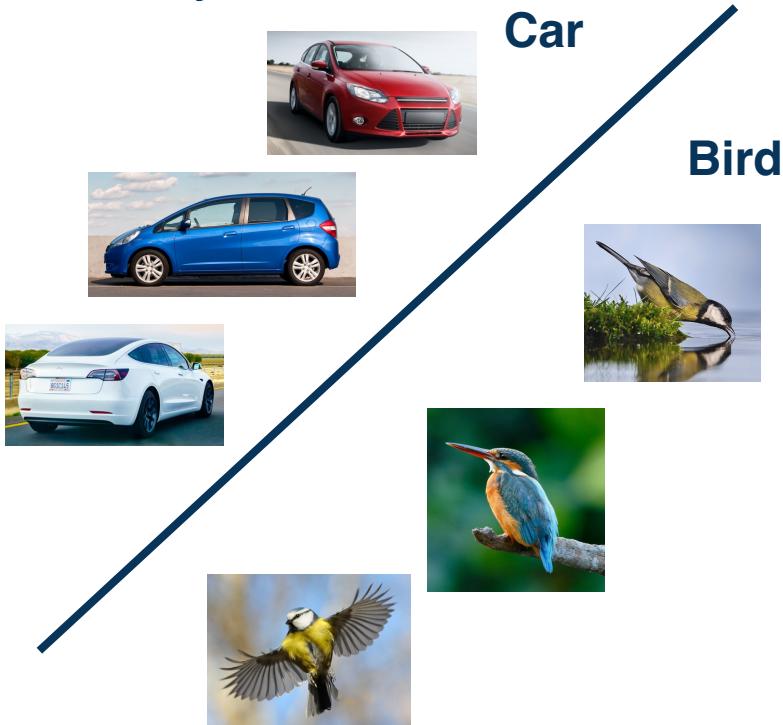

Class Scores

Optimizer

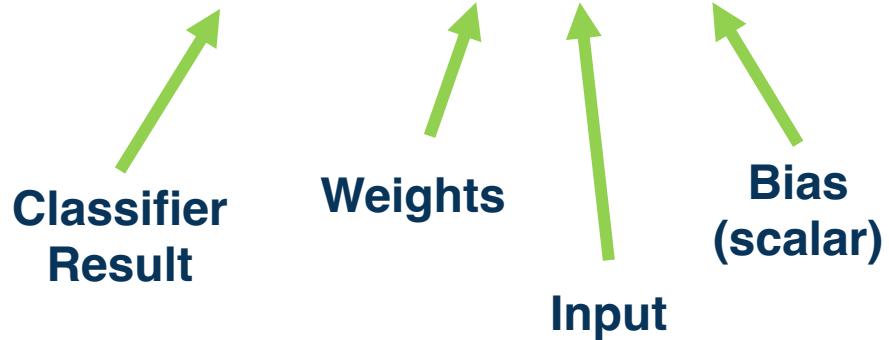

Components of a Parametric Model

What is the **simplest** function you can think of?

Our model is:

$$f(\mathbf{x}, \mathbf{w}) = \mathbf{w} \cdot \mathbf{x} + b$$

(Note if \mathbf{w} and \mathbf{x} are column vectors we often show this as $\mathbf{w}^T \mathbf{x}$)

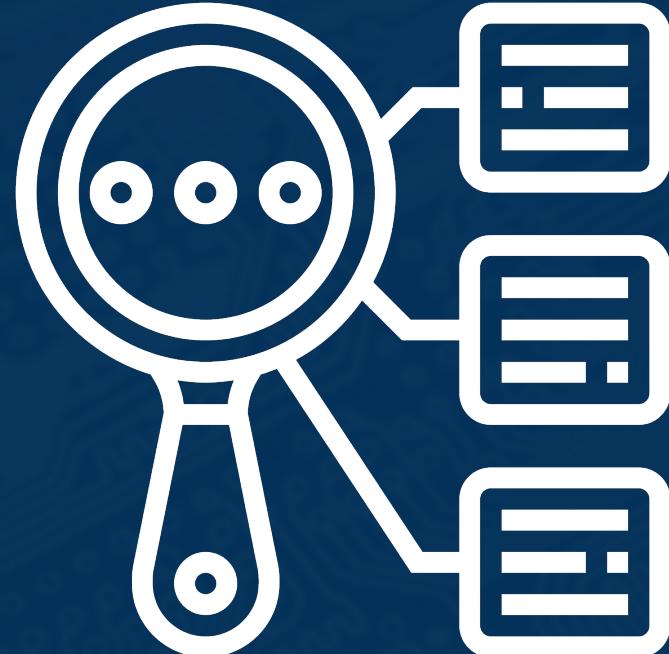

Linear Classification and Regression

Simple linear classifier:

- ◆ Calculate score:
 $f(x, w) = w \cdot x + b$
- ◆ Binary classification rule
(w is a vector):

$$y = \begin{cases} 1 & \text{if } f(x, w) \geq 0 \\ 0 & \text{otherwise} \end{cases}$$

- ◆ For multi-class classifier take class with highest (max) score
 $f(x, W) = Wx + b$

Data: Image

Model

$$f(x, W) = Wx + b$$

Class Scores

$$x = \begin{bmatrix} x_{11} & x_{12} & \cdots & x_{1n} \\ x_{21} & x_{22} & \cdots & x_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ x_{n1} & x_{n2} & \cdots & x_{nn} \end{bmatrix}$$

Flatten

$$x = \begin{bmatrix} x_{11} \\ x_{12} \\ \vdots \\ x_{21} \\ x_{22} \\ \vdots \\ x_{n1} \\ \vdots \\ x_{nn} \end{bmatrix}$$

To simplify notation we will refer to inputs as $x_1 \dots x_m$ where $m = n \times n$

Input Dimensionality

Model

$$f(\mathbf{x}, \mathbf{W}) = \mathbf{W}\mathbf{x} + \mathbf{b}$$

Classifier for class 1 $\xrightarrow{\hspace{1cm}}$ $\begin{bmatrix} w_{11} & w_{12} & \cdots & w_{1m} \end{bmatrix}$

Classifier for class 2 $\xrightarrow{\hspace{1cm}}$ $\begin{bmatrix} w_{21} & w_{22} & \cdots & w_{2m} \end{bmatrix}$

Classifier for class 3 $\xrightarrow{\hspace{1cm}}$ $\begin{bmatrix} w_{31} & w_{32} & \cdots & w_{3m} \end{bmatrix}$

$$\begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_m \end{bmatrix} + \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix}$$

\mathbf{W} \mathbf{x} \mathbf{b}

(Note that in practice, implementations can use $\mathbf{x}\mathbf{W}$ instead, assuming a different shape for \mathbf{W} . That is just a different convention and is equivalent.)

- We can move the bias term into the weight matrix, and a “1” at the end of the input
- Results in **one** matrix-vector multiplication!

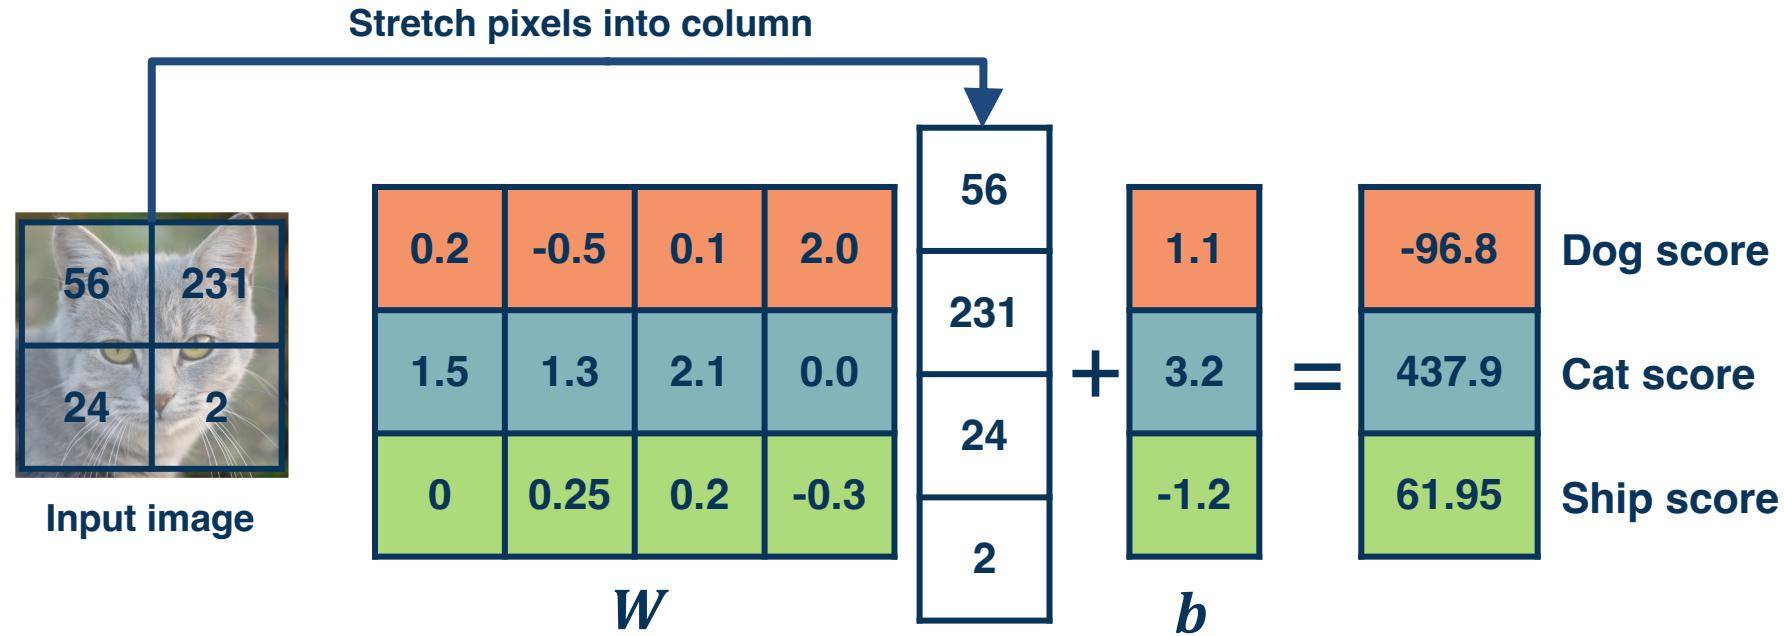

Model

$$f(\mathbf{x}, \mathbf{W}) = \mathbf{W}\mathbf{x} + \mathbf{b}$$

$$\begin{bmatrix} w_{11} & w_{12} & \cdots & w_{1m} & b_1 \\ w_{21} & w_{22} & \cdots & w_{2m} & b_2 \\ w_{31} & w_{32} & \cdots & w_{3m} & b_3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_m \\ 1 \end{bmatrix} = \mathbf{W}\mathbf{x}$$
