### CS 2750 Machine Learning Lecture 6

# **Density estimation II**

Milos Hauskrecht milos@cs.pitt.edu 5329 Sennott Square

CS 2750 Machine Learning

### **Announcements**

### Homework 2 in today

#### Homework 3 is out

- Due on Wednesday, February 4, before the class
- Reports: hand in before the class
- **Programs:** submit electronically

### **Outline**

#### **Outline:**

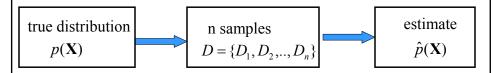

- Density estimation:
  - Maximum likelihood (ML)
  - Maximum a posteriori (MAP)
  - Bayesian
- · Binomial distribution
- Multinomial distribution.
- Normal distribution.

CS 2750 Machine Learning

## **Density estimation**

**Data:**  $D = \{D_1, D_2, ..., D_n\}$  $D_i = \mathbf{x}_i$  a vector of attribute values

**Objective:** try to estimate the underlying true probability distribution over variables X, p(X), using examples in D

### Standard (iid) assumptions: Samples

- are independent of each other
- come from the same (identical) distribution (fixed p(X))

# Learning via parameter estimation

In this lecture we consider **parametric density estimation Basic settings:** 

- A set of random variables  $\mathbf{X} = \{X_1, X_2, \dots, X_d\}$
- A model of the distribution over variables in X with parameters  $\Theta$ :  $\hat{p}(X | \Theta)$
- **Data**  $D = \{D_1, D_2, ..., D_n\}$

**Objective:** find parameters  $\hat{\Theta}$  that describe  $p(\mathbf{X}|\Theta)$  the best

CS 2750 Machine Learning

### Parameter estimation.

Maximum likelihood (ML)

maximize  $p(D | \Theta, \xi)$ 

- yields: one set of parameters  $\Theta_{ML}$
- the target distribution is approximated as:

$$\hat{p}(\mathbf{X}) = p(\mathbf{X} \mid \mathbf{\Theta}_{ML})$$

- · Bayesian parameter estimation
  - uses the posterior distribution over possible parameters

$$p(\Theta \mid D, \xi) = \frac{p(D \mid \Theta, \xi)p(\Theta \mid \xi)}{p(D \mid \xi)}$$

- Yields: all possible settings of  $\Theta$  (and their "weights")
- The target distribution is approximated as:

$$\hat{p}(\mathbf{X}) = p(\mathbf{X} \mid D) = \int_{\mathbf{\Theta}} p(X \mid \mathbf{\Theta}) p(\mathbf{\Theta} \mid D, \xi) d\mathbf{\Theta}$$

### Parameter estimation.

### Other possible criteria:

• Maximum a posteriori probability (MAP)

maximize  $p(\mathbf{\Theta} | D, \xi)$  (mode of the posterior)

- Yields: one set of parameters  $\Theta_{MAP}$
- Approximation:

$$\hat{p}(\mathbf{X}) = p(\mathbf{X} \mid \mathbf{\Theta}_{MAP})$$

· Expected value of the parameter

 $\hat{\mathbf{\Theta}} = E(\mathbf{\Theta})$  (mean of the posterior)

- Expectation taken with regard to posterior  $p(\mathbf{\Theta} \mid D, \xi)$
- Yields: one set of parameters
- Approximation:

$$\hat{p}(\mathbf{X}) = p(\mathbf{X} \mid \hat{\mathbf{\Theta}})$$

CS 2750 Machine Learning

### Binomial distribution.

Example problem: a biased coin

Outcomes: two possible values -- head or tail Data: D a set of order-independent outcomes

We treat D as a multi-set !!!

 $N_1$  - number of heads seen  $N_2$  - number of tails seen

**Model:** probability of a head probability of a tail  $(1-\theta)$ 

**Objective:** 

We would like to estimate the probability of a **head**  $\hat{\theta}$  **Probability of an outcome** 

$$P(D \mid \theta) = \binom{N}{N_1} \theta^{N_1} (1 - \theta)^{N_2}$$
 Binomial distribution

# Maximum likelihood (ML) estimate.

#### Likelihood of data:

$$P(D \mid \theta) = \binom{N}{N_1} \theta^{N_1} (1 - \theta)^{N_2} = \frac{N!}{N_1! N_2!} \theta^{N_1} (1 - \theta)^{N_2}$$

#### Log-likelihood

$$l(D,\theta) = \log \binom{N}{N_1} \theta^{N_1} (1-\theta)^{N_2} = \log \frac{N!}{N_1! N_2!} + N_1 \log \theta + N_2 \log(1-\theta)$$

Constant from the point of optimization !!!

**ML Solution:** 
$$\theta_{ML} = \frac{N_1}{N} = \frac{N_1}{N_1 + N_2}$$

The same as for Bernoulli and D with iid sequence of examples

CS 2750 Machine Learning

# **Posterior density**

**Posterior density** 

$$p(\theta \mid D, \xi) = \frac{P(D \mid \theta, \xi)p(\theta \mid \xi)}{P(D \mid \xi)} \quad \text{(via Bayes rule)}$$

**Prior choice** 

$$p(\theta \mid \xi) = Beta(\theta \mid \alpha_1, \alpha_2) = \frac{\Gamma(\alpha_1 + \alpha_2)}{\Gamma(\alpha_1)\Gamma(\alpha_2)} \theta^{\alpha_1 - 1} (1 - \theta)^{\alpha_2 - 1}$$

Likelihood

$$P(D \mid \theta) = \frac{\Gamma(N_1 + N_2)}{\Gamma(N_1)\Gamma(N_2)} \theta^{N_1} (1 - \theta)^{N_2}$$

**Posterior** 
$$p(\theta \mid D, \xi) = Beta(\alpha_1 + N_1, \alpha_2 + N_2)$$

MAP estimate 
$$\theta_{MAP} = \arg\max_{\theta} p(\theta \mid D, \xi)$$
$$\theta_{MAP} = \frac{\alpha_1 + N_1 - 1}{\alpha_1 + \alpha_2 + N_1 + N_2 - 2}$$

## **Expected value of the parameter**

The result is the same as for Bernoulli distribution

$$E(\theta) = \int_{0}^{1} \theta Beta(\theta \mid \eta_1, \eta_2) d\theta = \frac{\eta_1}{\eta_1 + \eta_2}$$

**Expected value of the parameter** 

$$E(\theta) = \frac{\alpha_1 + N_1}{\alpha_1 + N_1 + \alpha_2 + N_2}$$

**Predictive probability** of event x=1

$$P(x = 1 | \theta, \xi) = E(\theta) = \frac{\alpha_1 + N_1}{\alpha_1 + N_1 + \alpha_2 + N_2}$$

CS 2750 Machine Learning

### **Multinomial distribution**

**Example:** Multi-way coin toss, roll of dice

Data: a set of N outcomes (multi-set)
 N<sub>i</sub> - a number of times an outcome i has been seen

**Model parameters:** 
$$\mathbf{\theta} = (\theta_1, \theta_2, \dots \theta_k)$$
 **s.t.**  $\sum_{i=1}^k \theta_i = 1$   $\theta_i$  - probability of an outcome i

Probability of data (likelihood)

$$P(N_1, N_2, \dots N_k \mid \mathbf{\theta}, \xi) = \frac{N!}{N_1! N_2! \dots N_k!} \theta_1^{N_1} \theta_2^{N_2} \dots \theta_k^{N_k}$$
 **Multinomial** distribution

**ML** estimate:

$$\theta_{i,ML} = \frac{N_i}{N}$$

## Posterior density and MAP estimate

Choice of the prior: Dirichlet distribution

$$Dir(\boldsymbol{\theta} \mid \alpha_1, ..., \alpha_k) = \frac{\Gamma(\sum_{i=1}^k \alpha_i)}{\prod_{i=1}^k \Gamma(\alpha_i)} \theta_1^{\alpha_1 - 1} \theta_2^{\alpha_2 - 1} ... \theta_k^{\alpha_k - 1}$$

Dirichlet is the conjugate choice for multinomial

$$P(D \mid \mathbf{\theta}, \xi) = P(N_1, N_2, \dots N_k \mid \mathbf{\theta}, \xi) = \frac{N!}{N_1! N_2! \dots N_k!} \theta_1^{N_1} \theta_2^{N_2} \dots \theta_k^{N_k}$$

**Posterior density** 

$$p(\mathbf{\theta} \mid D, \xi) = \frac{P(D \mid \mathbf{\theta}, \xi) Dir(\mathbf{\theta} \mid \alpha_1, \alpha_2, ... \alpha_k)}{P(D \mid \xi)} = Dir(\mathbf{\theta} \mid \alpha_1 + N_1, ..., \alpha_k + N_k)$$

**MAP estimate:** 
$$\theta_{i,MAP} = \frac{\alpha_i + N_i - 1}{\sum_{i=1}^{n} (\alpha_i + N_i) - k}$$

CS 2750 Machine Learning

## **Expected value**

The result is analogous to the result for binomial

$$E(\mathbf{\theta}) = \int_{0 \le \theta_i \le 1, \sum \theta_i = 1} \mathbf{\theta} Dir(\mathbf{\theta} \mid \mathbf{\eta}) d\mathbf{\theta} = \left(\frac{\eta_1}{\eta_1 + \eta_2 + \eta_k}, \dots, \frac{\eta_i}{\eta_1 + \eta_2 + \eta_k}, \dots, \frac{\eta_k}{\eta_1 + \eta_2 + \eta_k}\right)$$

**Expectation based parameter estimate** 

$$E(\mathbf{\theta}) = \left(\frac{\alpha_1 + N_1}{\alpha_1 + N_1 + \dots + \alpha_k + N_k} \dots \frac{\alpha_i + N_i}{\alpha_1 + N_1 + \dots + \alpha_k + N_k} \dots \frac{\alpha_k + N_k}{\alpha_1 + N_1 + \dots + \alpha_k + N_k}\right)$$

Represents the predictive probability of an event x=i

$$P(x=i \mid \mathbf{\theta}, \xi) = \frac{\alpha_i + N_i}{\alpha_1 + N_1 + \dots + \alpha_k + N_k}$$

### Other distributions

### The same ideas can be applied to other distributions

- Typically we choose distributions that behave well so that computations lead to "nice" solutions
- Exponential family of distributions

**Conjugate choices** for some of the distributions from the exponential family:

- Binomial Beta
- Multinomial Dirichlet
- Exponential Gamma
- Poisson Inverse Gamma
- Gaussian Gaussian (mean) and Wishart (covariance)

CS 2750 Machine Learning

## Distributions from the exponential family

#### Gamma distribution:

$$p(x \mid a, b) = \frac{1}{\Gamma(a)b^a} x^{a-1} e^{-\frac{x}{b}}$$
 for  $x \in [0, \infty]$ 

#### **Exponential distribution:**

• A special case of Gamma for a=1

$$p(x \mid b) = \left(\frac{1}{b}\right)e^{-\frac{x}{b}}$$

#### **Poisson distribution:**

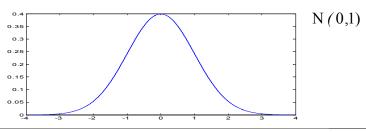

$$p(x \mid \lambda) = \frac{e^{-\lambda} \lambda^{x}}{x!} \qquad \text{for } x \in \{0,1,2,\dots\}$$

# Gaussian (normal) distribution

- Gaussian:  $x \sim N(\mu, \sigma)$
- **Parameters:**  $\mu$  mean
  - $\sigma$  standard deviation
- Density function:

$$p(x \mid \mu, \sigma) = \frac{1}{\sigma \sqrt{2\pi}} \exp\left[-\frac{1}{2\sigma^2} (x - \mu)^2\right]$$

• Example:

CS 2750 Machine Learning

## **Parameter estimates**

- Loglikelihood  $l(D, \mu, \sigma) = \log \prod_{i=1}^{n} p(x_i \mid \mu, \sigma)$
- ML estimates of the mean and variance:

$$\hat{\mu} = \frac{1}{n} \sum_{i=1}^{n} x_i$$

$$\hat{\sigma} = \frac{1}{n} \sum_{i=1}^{n} (x_i - \hat{\mu})^2$$

- ML variance estimate is biased

$$E_n(\sigma^2) = E_n\left(\frac{1}{n}\sum_{i=1}^n (x_i - \hat{\mu})^2\right) = \frac{n-1}{n}\sigma^2 \neq \sigma^2$$

• Unbiased estimate:

$$\hat{\sigma}^2 = \frac{1}{n-1} \sum_{i=1}^{n} (x_i - \hat{\mu})^2$$

### **Multivariate normal distribution**

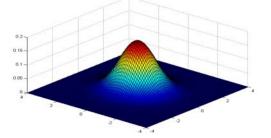

- Multivariate normal:  $\mathbf{x} \sim N(\boldsymbol{\mu}, \boldsymbol{\Sigma})$
- Parameters: μ- mean

 $\Sigma$ - covariance matrix

• Density function:

$$p(\mathbf{x} \mid \boldsymbol{\mu}, \boldsymbol{\Sigma}) = \frac{1}{(2\pi)^{d/2} |\boldsymbol{\Sigma}|^{1/2}} \exp \left[ -\frac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^T \boldsymbol{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu}) \right]$$

• Example:

CS 2750 Machine Learning

## **Parameter estimates**

- Loglikelihood  $l(D, \mu, \Sigma) = \log \prod_{i=1}^{n} p(\mathbf{x}_{i} | \mu, \Sigma)$
- ML estimates of the mean and covariances:

$$\hat{\boldsymbol{\mu}} = \frac{1}{n} \sum_{i=1}^{n} \mathbf{x}_{i} \qquad \qquad \hat{\boldsymbol{\Sigma}} = \frac{1}{n} \sum_{i=1}^{n} (\mathbf{x}_{i} - \hat{\boldsymbol{\mu}}) (\mathbf{x}_{i} - \hat{\boldsymbol{\mu}})^{T}$$

- Covariance estimate is biased

$$E_n(\hat{\Sigma}) = E_n \left( \frac{1}{n} \sum_{i=1}^n (\mathbf{x}_i - \hat{\boldsymbol{\mu}}) (\mathbf{x}_i - \hat{\boldsymbol{\mu}})^T \right) = \frac{n-1}{n} \boldsymbol{\Sigma} \neq \boldsymbol{\Sigma}$$

• Unbiased estimate:

$$\hat{\Sigma} = \frac{1}{n-1} \sum_{i=1}^{n} (\mathbf{x}_{i} - \hat{\boldsymbol{\mu}}) (\mathbf{x}_{i} - \hat{\boldsymbol{\mu}})^{T}$$

### Posterior of a multivariate normal

Assume a prior on the mean μ that is normally distributed:

$$p(\mathbf{\mu}) \approx N(\mathbf{\mu}_p, \mathbf{\Sigma}_p)$$

• Then the posterior of  $\mu$  is normally distributed

$$p(\boldsymbol{\mu} \mid D) \approx \left[ \prod_{i=1}^{n} \frac{1}{(2\pi)^{d/2} |\boldsymbol{\Sigma}|^{1/2}} \exp \left[ -\frac{1}{2} (\boldsymbol{x}_{i} - \boldsymbol{\mu})^{T} \boldsymbol{\Sigma}^{-1} (\boldsymbol{x}_{i} - \boldsymbol{\mu}) \right] \right]$$

$$* \frac{1}{(2\pi)^{d/2} |\boldsymbol{\Sigma}_{p}|^{1/2}} \exp \left[ -\frac{1}{2} (\boldsymbol{\mu} - \boldsymbol{\mu}_{p})^{T} \boldsymbol{\Sigma}_{p}^{-1} (\boldsymbol{\mu} - \boldsymbol{\mu}_{p}) \right]$$

$$= \frac{1}{(2\pi)^{d/2} |\boldsymbol{\Sigma}_{m}|^{1/2}} \exp \left[ -\frac{1}{2} (\boldsymbol{\mu} - \boldsymbol{\mu}_{n})^{T} \boldsymbol{\Sigma}_{n}^{-1} (\boldsymbol{\mu} - \boldsymbol{\mu}_{n}) \right]$$

CS 2750 Machine Learning

### Posterior of a multivariate normal

• Then the posterior of  $\mu$  is normally distributed

$$p(\boldsymbol{\mu} \mid D) = \frac{1}{(2\pi)^{d/2} |\boldsymbol{\Sigma}_n|^{1/2}} \exp\left[-\frac{1}{2} (\boldsymbol{\mu} - \boldsymbol{\mu}_n)^T \boldsymbol{\Sigma}_n^{-1} (\boldsymbol{\mu} - \boldsymbol{\mu}_n)\right]$$
$$\boldsymbol{\Sigma}_n^{-1} = n \boldsymbol{\Sigma}^{-1} + \boldsymbol{\Sigma}_p^{-1}$$

$$\boldsymbol{\mu}_{n} = \boldsymbol{\Sigma}_{p} \left( \boldsymbol{\Sigma}_{p} + \frac{1}{n} \boldsymbol{\Sigma} \right)^{-1} \left( \frac{1}{n} \sum_{i=1}^{n} x_{i} \right) + \frac{1}{n} \boldsymbol{\Sigma} \left( \boldsymbol{\Sigma}_{p} + \frac{1}{n} \boldsymbol{\Sigma} \right)^{-1} \boldsymbol{\mu}_{p}$$

$$\Sigma_n = \Sigma_p \left( \Sigma_p + \frac{1}{n} \Sigma \right)^{-1} \frac{1}{n} \Sigma$$

### Recursive Bayesian parameter estimation.

- Recursive Bayesian approach
  - Estimates of the posterior can be sometimes computed incrementally for a sequence of data points

$$p(\Theta \mid D, \xi) = \frac{p(D \mid \Theta, \xi)p(\Theta \mid \xi)}{\int\limits_{\Theta} p(D \mid \Theta, \xi)p(\Theta \mid \xi)d\Theta}$$

- If we use a conjugate prior we get back the same posterior
- Assume we split the data D in the last element **x** and the rest  $p(D \mid \mathbf{\Theta}) = P(x \mid \mathbf{\Theta})P(D_{n-1} \mid \mathbf{\Theta})$
- Then:

$$p(\Theta \mid D, \xi) = \frac{P(x \mid \mathbf{\Theta}) P(D_{n-1} \mid \mathbf{\Theta}) p(\Theta \mid \xi)}{\int P(x \mid \mathbf{\Theta}) P(D_{n-1} \mid \mathbf{\Theta}) p(\Theta \mid \xi) d\Theta}$$

CS 2750 Machine Learning

## **Exponential family**

### **Exponential family:**

• all probability mass / density functions that can be written in the exponential normal form

$$f(\mathbf{x} \mid \mathbf{\eta}) = \frac{1}{Z(\mathbf{\eta})} h(\mathbf{x}) \exp \left[ \mathbf{\eta}^T t(\mathbf{x}) \right]$$

- **n** a vector of natural (or canonical) parameters
- $t(\mathbf{x})$  a function referred to as a sufficient statistic
- $h(\mathbf{x})$  a function of x (it is less important)
- $Z(\mathbf{\eta})$  a normalization constant  $Z(\mathbf{\eta}) = \int h(\mathbf{x}) \exp \left\{ \mathbf{\eta}^T t(\mathbf{x}) \right\} d\mathbf{x}$
- Other common form:

$$f(\mathbf{x} \mid \mathbf{\eta}) = h(\mathbf{x}) \exp \left[\mathbf{\eta}^T t(\mathbf{x}) - A(\mathbf{\eta})\right]$$
 log  $Z(\mathbf{\eta}) = A(\mathbf{\eta})$ 

## **Exponential family: examples**

**Bernoulli distribution** 

$$p(x \mid \pi) = \pi^{x} (1 - \pi)^{1 - x}$$

$$= \exp\left\{\log\left(\frac{\pi}{1 - \pi}\right)x + \log(1 - \pi)\right\}$$

$$= \exp\left\{\log(1 - \pi)\right\} \exp\left\{\log\left(\frac{\pi}{1 - \pi}\right)x\right\}$$

**Exponential family** 

$$f(\mathbf{x} \mid \mathbf{\eta}) = \frac{1}{Z(\mathbf{\eta})} h(\mathbf{x}) \exp \left[ \mathbf{\eta}^T t(\mathbf{x}) \right]$$

**Parameters** 

$$\eta = ?$$

$$t(\mathbf{x}) = ?$$

$$Z(\mathbf{\eta}) = ?$$

$$h(\mathbf{x}) = ?$$

CS 2750 Machine Learning

## **Exponential family: examples**

**Bernoulli distribution** 

$$p(x \mid \pi) = \pi^{x} (1 - \pi)^{1 - x}$$

$$= \exp\left\{\log\left(\frac{\pi}{1 - \pi}\right)x + \log(1 - \pi)\right\}$$

$$= \exp\left\{\log(1 - \pi)\right\} \exp\left\{\log\left(\frac{\pi}{1 - \pi}\right)x\right\}$$

**Exponential family** 

$$f(\mathbf{x} \mid \mathbf{\eta}) = \frac{1}{Z(\mathbf{\eta})} h(\mathbf{x}) \exp \left[ \mathbf{\eta}^T t(\mathbf{x}) \right]$$

Parameters  

$$\eta = \log \frac{\pi}{1 - \pi}$$
 (note  $\pi = \frac{1}{1 + e^{-\eta}}$ )

$$t(\mathbf{x}) = x$$

$$Z(\mathbf{\eta}) = \frac{1}{1-\pi} = 1 + e^{\eta}$$

$$h(\mathbf{x}) = 1$$

## **Exponential family: examples**

**Univariate Gaussian distribution** 

$$p(x \mid \mu, \sigma) = \frac{1}{\sigma \sqrt{2\pi}} \exp\left[-\frac{1}{2\sigma^2} (x - \mu)^2\right]$$
$$= \frac{1}{2\pi} \exp\left(-\frac{\mu}{2\sigma^2} - \log \sigma\right) \exp\left\{\frac{\mu}{\sigma^2} x - \frac{1}{2\sigma^2} x^2\right\}$$

- **Exponential family**  $f(\mathbf{x} \mid \mathbf{\eta}) = \frac{1}{Z(\mathbf{n})} h(x) \exp \left[ \boldsymbol{\eta}^T t(x) \right]$
- **Parameters**

$$\eta = ?$$

$$t(\mathbf{x}) = ?$$

$$h(\mathbf{x}) = ?$$

CS 2750 Machine Learning

## **Exponential family: examples**

Univariate Gaussian distribution
$$p(x \mid \mu, \sigma) = \frac{1}{\sigma \sqrt{2\pi}} \exp\left[-\frac{1}{2\sigma^2} (x - \mu)^2\right]$$

$$= \frac{1}{2\pi} \exp\left(-\frac{\mu}{2\sigma^2} - \log \sigma\right) \exp\left\{\frac{\mu}{\sigma^2} x - \frac{1}{2\sigma^2} x^2\right\}$$

- **Exponential family**  $f(\mathbf{x} \mid \mathbf{\eta}) = \frac{1}{Z(\mathbf{\eta})} h(x) \exp \left[ \eta^T t(x) \right]$
- **Parameters**

$$\mathbf{\eta} = \begin{bmatrix} \mu / 2\sigma^2 \\ -1 / 2\sigma^2 \end{bmatrix} \qquad t(\mathbf{x}) = \begin{bmatrix} x \\ x^2 \end{bmatrix}$$
$$Z(\mathbf{\eta}) = \exp\left\{\frac{\mu}{2\sigma^2} + \log\sigma\right\} = \exp\left\{-\frac{\eta_1^2}{4\eta_2} - \frac{1}{2}\log(-2\eta_2)\right\}$$
$$h(\mathbf{x}) = 1/\sqrt{2\pi}$$

# **Exponential family**

· For iid samples, the likelihood of data is

$$P(D \mid \mathbf{\eta}) = \prod_{i=1}^{n} p(\mathbf{x}_{i} \mid \mathbf{\eta}) = \prod_{i=1}^{n} h(\mathbf{x}_{i}) \exp \left[\mathbf{\eta}^{T} t(\mathbf{x}_{i}) - A(\mathbf{\eta})\right]$$
$$= \left[\prod_{i=1}^{n} h(\mathbf{x}_{i})\right] \exp \left[\sum_{i=1}^{n} \mathbf{\eta}^{T} t(\mathbf{x}_{i}) - A(\mathbf{\eta})\right]$$
$$= \left[\prod_{i=1}^{n} h(\mathbf{x}_{i})\right] \exp \left[\mathbf{\eta}^{T} \left(\sum_{i=1}^{n} t(\mathbf{x}_{i})\right) - nA(\mathbf{\eta})\right]$$

- **Important:** 
  - the dimensionality of the sufficient statistic remains the same with the number of samples

CS 2750 Machine Learning

## **Exponential family**

• log likelihood of data is
$$l(D, \mathbf{\eta}) = \log \left[ \prod_{i=1}^{n} h(\mathbf{x}_{i}) \right] \exp \left[ \mathbf{\eta}^{T} \left( \sum_{i=1}^{n} t(\mathbf{x}_{i}) \right) - nA(\mathbf{\eta}) \right]$$

$$= \log \left[ \prod_{i=1}^{n} h(\mathbf{x}_{i}) \right] + \left[ \mathbf{\eta}^{T} \left( \sum_{i=1}^{n} t(\mathbf{x}_{i}) \right) - nA(\mathbf{\eta}) \right]$$

Optimizing the loglikelihood

$$\nabla_{\mathbf{\eta}} l(D, \mathbf{\eta}) = \left(\sum_{i=1}^{n} t(\mathbf{x}_{i})\right) - n \nabla_{\mathbf{\eta}} A(\mathbf{\eta}) = \mathbf{0}$$

For the ML estimate it must hold

$$\nabla_{\mathbf{\eta}} A(\mathbf{\eta}) = \frac{1}{n} \left( \sum_{i=1}^{n} t(\mathbf{x}_{i}) \right)$$

# **Exponential family**

• Rewritting the gradient:

CS 2750 Machine Learning

# **Exponential family**

• Rewritting the gradient:

$$\nabla_{\eta} A(\eta) = \nabla_{\eta} \log Z(\eta) = \nabla_{\eta} \log \int h(\mathbf{x}) \exp \left\{ \eta^{T} t(\mathbf{x}) \right\} d\mathbf{x}$$

$$\nabla_{\eta} A(\eta) = \frac{\int t(\mathbf{x}) h(\mathbf{x}) \exp \left\{ \eta^{T} t(\mathbf{x}) \right\} d\mathbf{x}}{\int h(\mathbf{x}) \exp \left\{ \eta^{T} t(\mathbf{x}) \right\} d\mathbf{x}}$$

$$\nabla_{\eta} A(\eta) = \int t(\mathbf{x}) h(\mathbf{x}) \exp \left\{ \eta^{T} t(\mathbf{x}) - A(\eta) \right\} d\mathbf{x}$$

$$\nabla_{\eta} A(\eta) = E(t(\mathbf{x}))$$

- Result:  $E(t(\mathbf{x})) = \frac{1}{n} \left( \sum_{i=1}^{n} t(\mathbf{x}_i) \right)$
- For the ML estimate the parameters η should be adjusted such that the expectation of the statistic t(x) is equal to the observed sample statistics

### Moments of the distribution

- For the exponential family
  - The k-th moment of the statistic corresponds to the k-th derivative of  $A(\eta)$
  - If x is a component of t(x) then we get the moments of the distribution by differentiating its corresponding natural parameter
- Example: Bernoulli  $p(x \mid \pi) = \exp\left\{\log\left(\frac{\pi}{1-\pi}\right)x + \log(1-\pi)\right\}$  $A(\eta) = \log\frac{1}{1-\pi} = \log(1+e^{\eta})$
- Derivatives:

$$\frac{\partial A(\mathbf{\eta})}{\partial \eta} = \frac{\partial}{\partial \eta} \log(1 + e^{\eta}) = \frac{e^{\eta}}{(1 + e^{\eta})} = \frac{1}{(1 + e^{-\eta})} = \pi$$
$$\frac{\partial A(\mathbf{\eta})}{\partial \eta^2} = \frac{\partial}{\partial \eta} \frac{1}{(1 + e^{-\eta})} = \pi (1 - \pi)$$
